

Cluster Statement		Standard	Keep or Propose Change	Type of Change: Removed, Broken Up, Re-written	Quality Standards Rule	Reason for Proposed Change
Write and interpret numerical expressions.	5.OA.1	5.OA.1 Use and explain parentheses, brackets, or braces in numerical expressions, and evaluate expressions with these symbols.	change	rewritten	#3	To focus on the numerical understanding of the expression versus the process.
Write and interpret numerical expressions.	5.OA.2	5.OA.2 Write simple expressions that record calculations with numbers to represent real world problems , and interpret numerical expressions without evaluating them. <i>(For example, express the calculation "add 8 and 7, then multiply by 2" as $2 \times (8 + 7)$. Recognize that $3 \times (18932 + 921)$ is three times as large as $18932 + 921$, without having to calculate the indicated sum or product.)</i>	change	rewritten	#3	To focus on the numerical understanding of the expression versus the process.
Analyze patterns and relationships.	5.OA.3	5.OA.3 Generate two numerical patterns using two given rules. Identify apparent relationships between corresponding terms. Form ordered pairs consisting of corresponding terms from the two patterns, and graph the ordered pairs on a coordinate plane. Identify the relationship between the two patterns. <i>For example, given the rule "Add 3" and the starting number 0, and given the rule "Add 6" and the starting number 0, generate terms in the resulting sequences, and observe that the terms in one sequence are twice the corresponding terms in the other sequence. Explain informally why this is so.</i>	change	rewritten	#3	Clarifying that the idea of this standard is the algebraic relationship between the two patterns.
Understand the place value system.	5.NBT.1	5.NBT.1 Recognize that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its right and 1/10 of what it represents in the place to its left.	keep			
Understand the place value system.	5.NBT.2	5.NBT.2 Explain and apply patterns in the number of zeros of the product when multiplying a number by powers of 10. and Explain and apply patterns in the placement of the decimal point with respect to the values of the digits in the product or the quotient , when a decimal is multiplied or divided by a power of 10. Use whole-number exponents to denote powers of 10.	Change	rewritten	#3	We felt the Louisiana wording was clearer and focused on understanding and applying.
Understand the place value system.	5.NBT.3	5.NBT.3 Read, write, and compare decimals to thousandths. 3a. Read and write decimals to thousandths using base-ten numerals, number names, and expanded form, e.g., $347.392 = 3 \times 100 + 4 \times 10 + 7 \times 1 + 3 \times (1/10) + 9 \times (1/100) + 2 \times (1/1000)$. 3b. Compare two decimals to thousandths based on meanings of the digits in each place, using $>$, $=$, and $<$ symbols to record the results of comparisons.	keep			
Understand the place value system.	5.NBT.4	5.NBT.4 Use place value understanding to round decimals to any place.	keep			
Perform operations with multi-digit whole numbers and with decimals to hundredths.	5.NBT.5	5.NBT.5 Fluently multiply multi-digit whole numbers using an algorithm, including but not limited to the standard algorithm.	change		#1	Wanted to expand the scope of possible strategies that could be used in problems.

Cluster Statement		Standard	Keep or Propose Change	Type of Change: Removed, Broken Up, Re-written	Quality Standards Rule	Reason for Proposed Change
Perform operations with multi-digit whole numbers and with decimals to hundredths.	5.NBT.6	5.NBT.6 Find whole-number quotients of whole numbers with up to four-digit dividends and two-digit divisors, using strategies based on place value, the properties of operations, and/or the relationship between multiplication and division. Illustrate and Explain the calculation by using equations, rectangular arrays, or illustrations , or-area models, or other representations based on place value.	change	rewritten	#3	At this level, if a fifth grade can explain in words without an illustration, that is acceptable. We wanted other strategies based on place value to keep options for students.
Perform operations with multi-digit whole numbers and with decimals to hundredths.	5.NBT.7	5.NBT.7 Add, subtract, multiply, and divide decimals to hundredths, using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method and explain the reasoning used justify the reasoning used with a written explanation.	change	rewritten	#3	"Relate the strategy to a written method" and "explain the reasoning" seemed redundant
Use equivalent fractions as a strategy to add and subtract fractions.	5.NF.1	5.NF.1 Add and subtract fractions with unlike denominators (including mixed numbers) by replacing given fractions with equivalent fractions.- in such a way as to produce an equivalent sum or difference of fractions with a like denominator denominator . <i>For example, $2/3 + 5/4 = 8/12 + 15/12 = 23/12$. (In general, $a/b + c/d = (ad + bc)/bd$.)</i> *See Note	change	rewritten	#3	We felt that the intent of this was to let teachers know that students do not need to simplify at the end, so we tried to clarify the last sentence.
Use equivalent fractions as a strategy to add and subtract fractions.	5.NF.2	5.NF.2 a. Solve word problems involving addition and subtraction of fractions referring to the same whole, including cases of unlike denominators, e.g., by using visual fraction models or equations to represent the problem. b. Use benchmark fractions and number sense of fractions to estimate mentally and assess the reasonableness of answers. <i>For example, recognize an incorrect result $2/5 + 1/2 = 3/7$, by observing that $3/7 < 1/2$.</i>	change	broken up	#1	this standard has two separate ideas, so we broke it into a and b
Apply and extend previous understandings of multiplication and division to multiply and divide fractions.	5.NF.3	5.NF.3 Interpret a fraction as division of the numerator by the denominator ($a/b = a \div b$). Solve word problems involving division of whole numbers leading to answers in the form of fractions or mixed numbers, e.g., by using visual fraction models or equations to represent the problem. <i>For example, interpret $3/4$ as the result of dividing 3 by 4, noting that $3/4$ multiplied by 4 equals 3, and that when 3 wholes are shared equally among 4 people each person has a share of size $3/4$. If 9 people want to share a 50-pound sack of rice equally by weight, how many pounds of rice should each person get? Between what two whole numbers does your answer lie?</i>	keep			

Cluster Statement		Standard	Keep or Propose Change	Type of Change: Removed, Broken Up, Re-written	Quality Standards Rule	Reason for Proposed Change
Apply and extend previous understandings of multiplication and division to multiply and divide fractions.	5.NF.4	<p>5.NF.4 Apply and extend previous understandings of multiplication to multiply a fraction or whole number by a fraction.</p> <p>4a. Interpret the product $(a/b) \times q$ as a parts of a partition of q into b equal parts; equivalently, as the result of a sequence of operations $a \times q \div b$. <i>For example, use a visual fraction model to show $(2/3) \times 4 = 8/3$, and create a story context for this equation. Do the same with $(2/3) \times (4/5) = 8/15$. (In general, $(a/b) \times (c/d) = ac/bd$.)</i></p> <p>4b. Find the area of a rectangle with fractional side lengths by tiling it with unit squares of the appropriate unit fraction side lengths, and show that the area is the same as would be found by multiplying the side lengths. Multiply fractional side lengths to find areas of rectangles, and represent fraction products as rectangular areas.</p>	keep			
Apply and extend previous understandings of multiplication and division to multiply and divide fractions.	5.NF.5	<p>5.NF.5 Interpret multiplication as scaling (resizing), by:</p> <p>5a. Comparing the size of a product to the size of one factor on the basis of the size of the other factor, without performing the indicated multiplication.</p> <p>5b. Explaining why multiplying a given number by a fraction greater than 1 results in a product greater than the given number (recognizing multiplication by whole numbers greater than 1 as a familiar case); explaining why multiplying a given number by a fraction less than 1 results in a product smaller than the given number; and relating the principle of fraction equivalence $a/b = (n \times a)/(n \times b)$ to the effect of multiplying a/b by 1.</p>	keep			
Apply and extend previous understandings of multiplication and division to multiply and divide fractions.	5.NF.6	<p>5.NF.6 Solve real world problems involving multiplication of fractions and mixed numbers, e.g., by using visual fraction models or equations to represent the problem.</p>	keep			

Cluster Statement		Standard	Keep or Propose Change	Type of Change: Removed, Broken Up, Re-written	Quality Standards Rule	Reason for Proposed Change
Apply and extend previous understandings of multiplication and division to multiply and divide fractions.	5.NF.7	5.NF.7 Apply and extend previous understandings of division to divide unit fractions by whole numbers and whole numbers by unit fractions. *See Note 7a. Interpret division of a unit fraction by a non-zero whole number, and compute such quotients. <i>For example, create a story context for $(1/3) \div 4$, and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that $(1/3) \div 4 = 1/12$ because $(1/12) \times 4 = 1/3$.</i> 7b. Interpret division of a whole number by a unit fraction, and compute such quotients. <i>For example, create a story context for $4 \div (1/5)$, and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that $4 \div (1/5) = 20$ because $20 \times (1/5) = 4$.</i> 7c. Solve real world problems involving division of unit fractions by non-zero whole numbers and division of whole numbers by unit fractions, e. g., by using visual fraction models and equations to represent the problem. <i>For example, how much chocolate will each person get if 3 people share $1/2$ lb of chocolate equally? How many $1/3$-cup servings are in 2 cups of raisins?</i>	Keep			
Convert like measurement units within a given measurement system.	5.MD.1	5.MD.1 Convert among different sized standard customary and metric measurement units within a given measurement system (e.g., convert 5 cm to 0.05 m). and Use these conversions in solving multi-step, real world problems involving distances, intervals of time, liquid volumes, masses of objects, and money (including problems involving simple fractions or decimals). For example, 3.6 liters and 4.1 liters can be combined as 7.7 liters or 7700 milliliters.	Change	rewritten	#3	The wording from Tennessee clarifies that both customary and metric need to be used, and also aligned the problem with the fourth grade wording.
Represent and interpret data.	5.MD.2	5.MD.2 Make a line plot to display a data set. of measurements in fractions of a unit ($1/2, 1/4, 1/8$). 2a. Use operations on fractions of a unit ($1/2, 1/4, 1/8$) for this grade to solve problems involving information presented in line plots. 2b. Use information from a line plot representing an unequal situation and redistribute whole or fractional parts to create an equal distribution. <i>For example, given different measurements of liquid in identical beakers, find the amount of liquid each beaker would contain if the total amount in all the beakers were redistributed equally.</i>	Change	rewritten/added	#1	Algebra wanted a better foundation for Mean Absolute Deviation, by building understanding in fifth grade.
Geometric measurement: understand concepts of volume and relate volume to multiplication and to addition.	5.MD.3	5.MD.3 Recognize volume as an attribute of solid figures and understand concepts of volume measurement. 3a. A cube with side length 1 unit, called a "unit cube," is said to have "one cubic unit" of volume, and can be used to measure volume. 3b. A solid figure which can be packed without gaps or overlaps using n unit cubes is said to have a volume of n cubic units.	Keep			
Geometric measurement: understand concepts of volume and relate volume to multiplication and to addition.	5.MD.4	5.MD.4 Measure volumes by counting unit cubes, using cubic cm, cubic in, cubic ft, and improvised units.	Keep			

Cluster Statement		Standard	Keep or Propose Change	Type of Change: Removed, Broken Up, Re-written	Quality Standards Rule	Reason for Proposed Change
Geometric measurement: understand concepts of volume and relate volume to multiplication and to addition.	5.MD.5	<p>5.MD.5 Relate volume to the operations of multiplication and addition and solve real world and mathematical problems involving volume.</p> <p>5a. Find the volume of a right rectangular prism with whole-number side lengths by packing it with unit cubes, and show that the volume is the same as would be found by multiplying the edge lengths, equivalently by multiplying the height by the area of the base.</p> <p>5b. Represent threefold whole-number products as volumes, e.g., to represent the associative property of multiplication.</p> <p>5c. Apply the formulas $V = l \times w \times h$ and $V = B \times h$ (where B is the area of the base) for rectangular prisms to find volumes of right rectangular prisms with whole number edge lengths in the context of solving real world and mathematical problems.</p> <p>5d. Recognize volume as additive. Find volumes of solid figures composed of two non-overlapping right rectangular prisms by adding the volumes of the non-overlapping parts, applying this technique to solve real world problems.</p>	change	broken up	#1	we thought "a" needed to be split because the two parts seemed to have a different intent
Graph points on the coordinate plane to solve real-world and mathematical problems.	5.G.1	5.G.1 Use a pair of perpendicular number lines, called axes, to define a coordinate system, with the intersection of the lines (the origin) arranged to coincide with the 0 on each line and a given point in the plane located by using an ordered pair of numbers, called its coordinates. Understand that the first number indicates how far to travel from the origin in the direction of one axis, and the second number indicates how far to travel in the direction of the second axis, with the convention that the names of the two axes and the coordinates correspond (e.g., x-axis and x-coordinate, y-axis and y-coordinate).	Keep			
Graph points on the coordinate plane to solve real-world and mathematical problems.	5.G.2	5.G.2 Represent real world and mathematical problems by graphing points in the first quadrant of the coordinate plane, and interpret coordinate values of points in the context of the situation.	Keep			
Classify two-dimensional figures into categories based on their properties.	5.G.3	5.G.3 Understand that attributes belonging to a category of two-dimensional figures also belong to all subcategories of that category. <i>For example, all rectangles have four right angles and squares are rectangles, so all squares have four right angles.</i>	Keep			
Classify two-dimensional figures into categories based on their properties.	5.G.4	5.G.4 Classify two-dimensional figures in a hierarchy based on properties. <i>For example, all rectangles are parallelograms, because they are all quadrilaterals with two pairs of opposite, parallel, equal-length sides</i>	change	rewritten	#3	To Clarify heirarchy
