## Unpacked South Dakota State Mathematics Standards

Purpose: In order for students to have the best chance of success, standards, assessment, curriculum resources, and instruction must be aligned in focus, coherence, and rigor. Unpacked standards documents are intended to help align instruction to the focus, coherence, and rigor of the South Dakota State Mathematics Standards. The standards have been organized in clusters as they are not so much built from topics, but rather woven out of progressions. Not all content in a given grade is emphasized equally in the mathematics standards. Some clusters require greater emphasis than others based on the depth of the ideas, the time that they take to master, and/or their importance to future mathematics or the demands of college and career readiness. To say that some things have greater emphasis is not to say that anything in the standards can safely be neglected in instruction. Neglecting standards will leave gaps in student skill and understanding and may leave students unprepared for the challenges of a later grade.

## Domain: Statistics and Probability

## Grade Level: 7th

## 7.SP.A Cluster: Use random sampling to draw inferences about a population.

Students learn about sampling populations and that a sampling must be representative of the population in order to make valid inferences and generalizations. To measure variation and estimates or predictions about a characteristic, students must conduct multiple samples of the same size from populations with an unknown characteristics.
**This is a SUPPORTING cluster. Students should spend the large majority of their time (65-85\%) on the major work of the grade. Supporting work and, where appropriate, additional work should be connected to and engage students in the major work of the grade.
7.SP. 1 Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences.
7.SP. 2 Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions. For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be.

Aspects of Rigor for Student Learning:(Conceptual, Procedural, and/or Application)

| Conceptual Understanding | Procedural Fluency | Application |
| :--- | :--- | :--- |
| Understand that a random sample <br> can be used to represent the total <br> population and will generate valid <br> results. (7.SP.1) |  |  |
| Understand that a random sample <br> must be used that accurately <br> represents the population. For <br> example, a random sample of <br> elementary students should not be <br> used to make generalizations about <br> the prom. (7.SP.1) |  |  |
| Identify factors that might create bias. <br> (7.SP.1) |  |  |

| Understand information from a <br> random sample can be used to make <br> inferences about an entire population. <br> (7.SP.2) | Use a sample to make an inference. <br> (7.SP.2) | Use data from a random sample to <br> generalize features of the population <br> from which the sample was selected. <br> (7.SP.2) |
| :--- | :--- | :--- |
| random sample to respond to a |  |  |
| statistical question. (7.SP.2) |  |  |$\quad$| Use a sample to make an inference, |
| :--- |
| then explore the variation in estimates |
| or predictions based on multiple |
| samples from the same data. (7.SP.2) |

Relevance, Explanations, and Examples:

Results of simulations
Sample Proportions

Proportions of red chips in 200 random samples of size 50 from a population in which $60 \%$ of the chips are red.

Sample Proportions

Proportions of red chips in 200 random samples of size 50 from a population in which $50 \%$ of the chips are red.

Proportions of red chips in 200 random samples of size 50 from a population in which $40 \%$ of the chips are red.

Achievement Level Descriptors

Cluster: Use random sampling to draw inferences about a population.
Concepts and Procedures

Level 1: Level 1 students should be able to describe what a representative sample entails and identify biased and unbiased samples of a population.

Level 2: Level 2 students should be able to determine whether or not a sample is random and understand that random samples of an appropriate population are representative samples that support valid results. They should be able to use data from a random sample to draw obvious inferences about a population presented in a familiar context.

Level 3: Level 3 students should be able to use data from a random sample to draw inferences about a population with an unknown characteristic of interest presented in an unfamiliar context.

Level 4: Level 4 students should be able to generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions.
